Ants

Ants are social insects that belong to the same biological order as bees and wasps. Each ant is a member of a highly organised colony which can be as large as millions of insects. Inside one single nest, there are workers, soldiers, drones and queens and colonies of ants can occupy and use a wide area of land to support them.

There are about almost 12,000 known ant species, most of which are tropical. Ants are extremely social creatures and their ability to adapt to most environments has enabled them to live on almost every landmass on Earth.

While DIY products can deal with smaller ant problems or problems with garden ants, a professional ant pest control service will be required for larger or multiple infestations and this will certainly be the case when the ants are Pharoah's Ants.

Pestforce understands the habits of each species of ant and also have a range of powerful insecticides to deal with ants and also provide you with the reassurance that the ant problem has been fully dealt with.

Cockroaches

Cockroaches are distinguished by their very long whip-like antennae, flat oval bodies and rapid, jerky gait.

The adult German cockroach is 10 to 15mm long. The Common or Oriental cockroach is 20 to 24mm long. They find it difficult to survive out of doors in the British climate, which makes them a pest. They thrive around the heating ducts and boiler rooms of large centrally heated buildings e.g. hospitals, bakeries, hotel and restaurant kitchens, laundries and blocks of flats. They cluster around pipes, stoves, and sinks, especially in humid areas.

The German cockroach carries its egg case, a small brown purse-like capsule, until the 30 or more nymphs are ready to hatch from it. The Oriental cockroach deposits its 13mm long egg capsule on packaging, sacking or in suitable dark crevices before the 16 or 18 nymphs hatch out.

Cockroaches will eat any type of food and are mainly nocturnal. They travel from their inaccessible harbourages to feed, contaminating food and food utensils and food preparation areas as they move – hence the need for cockroach pest control.

Cockroaches taint food with an unpleasant odour and can carry of various diseases, including serious food poisoning.

GEO Pest applies an insecticide in aerosol form sprayed into all possible harbourages & Herbal Gel.

Flies

Food is the main reason that flies (such as house flies & bottle flies) are attracted into our homes. This is because it is a perfect environment for fly larvae to grow:

- ✓ Always cover food – diseases are spread by flies landing on food via their feet
- ✓ Clean food crumbs from underneath objects in the kitchen
- ✓ Clear away spillages
- ✓ Store compost effectively
- ✓ Tightly seal all refuse areas
- ✓ Clean up after pets – not only are faeces the perfect breeding place for flies but also somewhere a fly may land before landing on your food
